About me

I have spent more than 2 decades building enterprise applications. I have been doing architecture consulting, architecture review, architecture PoC(s) for more than 15 yrs now. I have built products for my customers from inception to transition. I have been into full stack development since the time when the term full stack was not even coined. Product Development Allow me to blow my trumpet - I challenge you to find a profile of someone who is proficient in leading UX & UI, has thorough understanding of system of colors, proficient in writing angular code along while architecting huge front-end solutions and at the same time extremely proficient in database design, elk, cloud technologies, spring cloud, dev-ops and last but not the least tune the GC of JVM with utmost proficiency : share with me his/her profile. I will do a 50 hrs of free consulting for you. Architecture Consulting, Architecture PoC(s), Architecture Review Architecture is the backbone of any software solution. If the architecture is strong and robust, it will be resilient & adaptive to changes. Selection of right tools and technologies, 3rd party libraries, frameworks and products is of utmost importance to contain & mitigate technical risks. Moreover, understanding business domains and mapping the business needs to the software solution is my forte. I leave my customers thrilled with the solution I provide. I not only provide architectural solutions on paper. I do executable PoC(s) that helps to validate the architectural decisions. If you already have architecture in place, then I can do a review and give you the pros and cons of the architectural approach taken by your architect. *** Micro-Services based architecture *** If you are looking for a micro-services based solution, I can help you to break-down your large monolith application into micro-services based solution. I will help you to identify bounded-context(s) in your domain and identify the right domain entities and aggregates. Based on these bounded-contexts and aggregates, we can derive edge and mid-layer services. Take a look at one such project that I did for client in U.S (details under portfolio section)
